As experts in rubber engineering, we are renowned for our innovative solutions. We are also aware of the impact that high volume rubber manufacture can have on the environment.

We have developed a unique way to use those end-of-life products by breaking down the vulcanised bonds and incorporating them into new rubber compound.

These compounds are used for re-moulding into brand new products. As with standard compounds, products manufactured from Envirolast have reliable, repeatable physical properties and a high-quality finish.

ENVIROLAST

Recycled rubber for a greener future

It's a win-win: you reduce your environmental impact with no compromise on quality.
